

Public Managers and Hospital Performance

Cristóbal Otero Pablo Muñoz

UC Berkeley U de Chile

October 1, 2022

[[Click here for the latest version](#)]

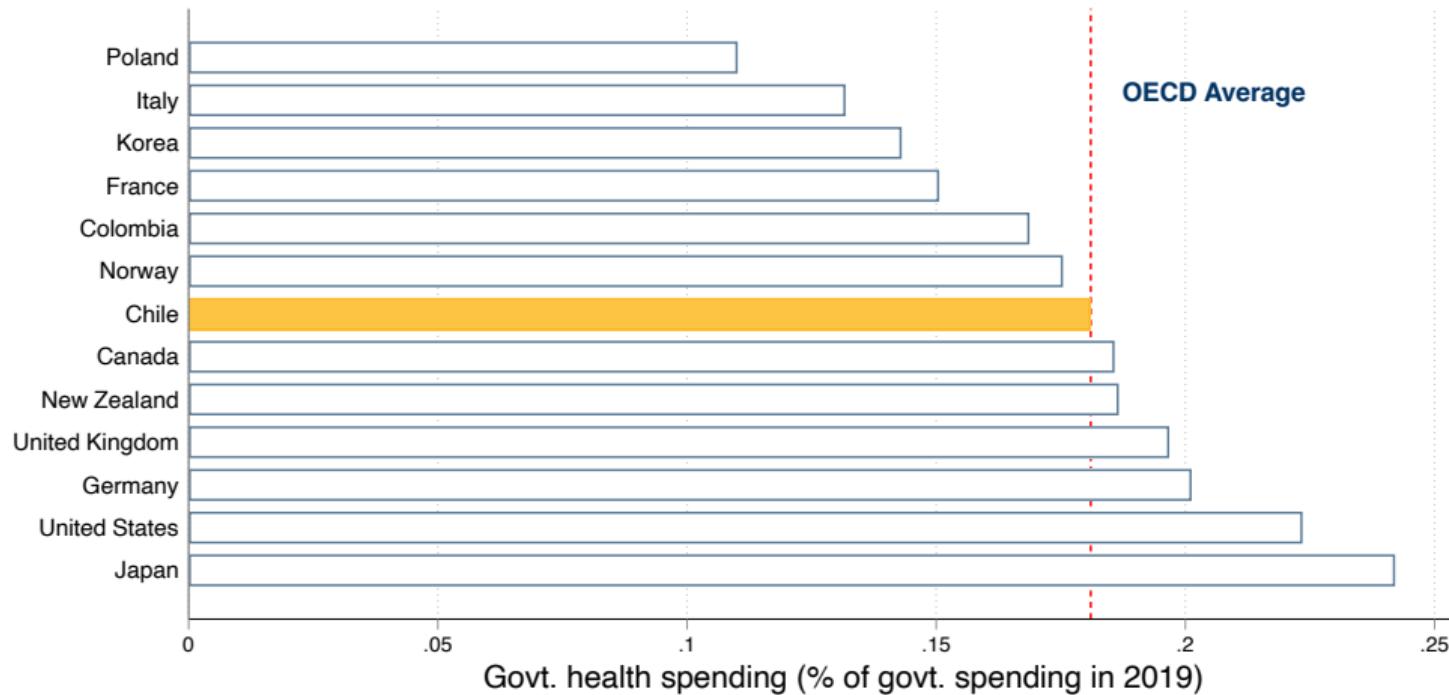

Productivity & govt. efficient spending

- Governments play a prominent role in the economy through spending
- ⇒ Enhancing state efficiency is central to any effort to boost overall productivity
- Popular policy to raise state productivity is to place emphasis on public managers
(OECD 2008, Pollitt & Bouckaert 2017)
- Research on whether and how public managers matter is limited
(Janke et al. 2020, Bertrand et al. 2020, Fenizia 2022, Besley et al. 2022)
 1. lack of objective and verifiable performance outcomes in the public sector
 2. shortage of quasiexperimental variation

This paper

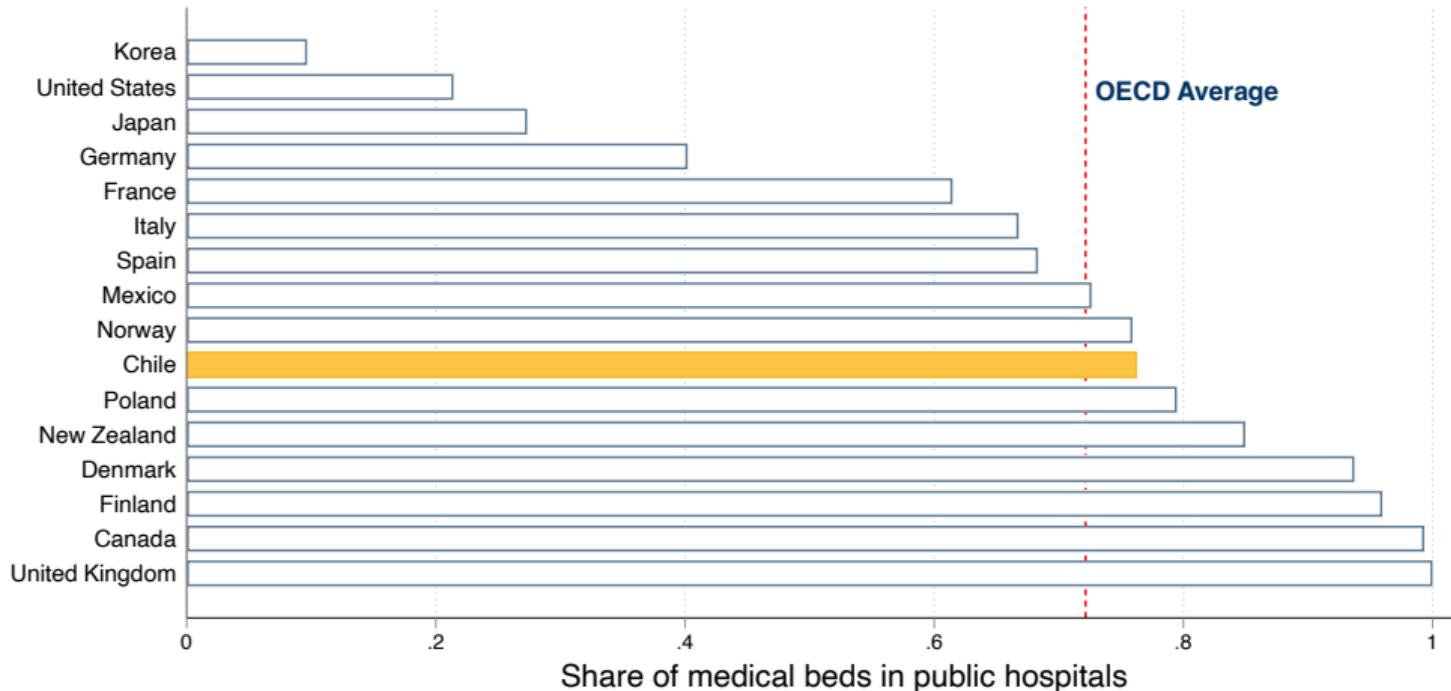

- Study a selection reform in Chile that changed the recruitment process for public managers
- ⇒ Examine the impact of the selection reform on public sector outcomes
- Focus on public hospitals
 - observe objective, reliable, and relevant short-term outcomes
 - health sector is large and costly
 - public hospitals are important for access and equity

Health sector is large and costly

- Health care spending increasing rapidly: 15% in OECD countries (2000-19)

Public hospitals are important for access and equity

- Maintain a minimum level of access in underserved communities

Chile provides a well suited case study

- In 2003, govt. introduced a reform to strengthen selection system of senior executives
 1. Recruitment: open, transparent, and competitive
 2. Financial incentives: performance pay & higher wages
- Very limited scope for selection in public tertiary care
 - within the public health system, patients cannot choose providers
 - predetermined referral system from primary care to public hospitals
 - hospitals cannot choose (reject) patients

Preview of findings

1. Reform reduced hospital mortality between 9% - 14%
 - results are not driven by change in patient composition
 - similar to other health policy interventions
2. Conditional on being selected, financial incentives in the reform do not drive results
 - performance pay was a extremely small part of compensation + poorly designed
 - no effects of higher wage on performance
3. Reform substantially changed the characteristics pool of CEOs
 - recruited younger CEOs with training in management
 - displaced older doctor CEOs with no management training
 - impact on hospital mortality highest when new CEOs had management training

Outline

1. Setting and data
2. Reform impact on hospital performance
3. Recruitment effects of the reform
4. Role of financial incentives included in the reform
5. Conclusion

Senior executives selection reform

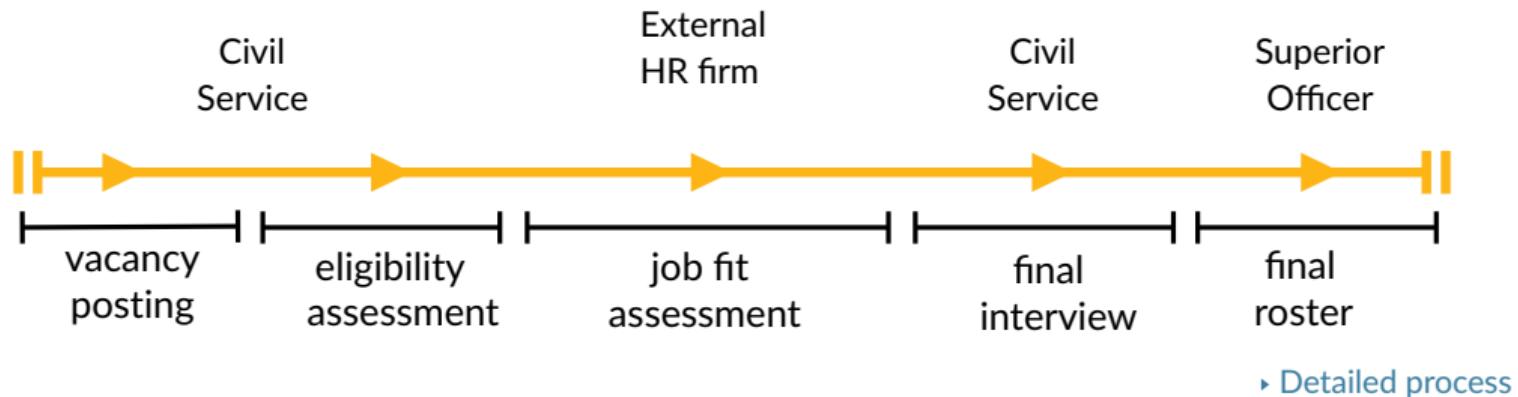

- In 2003, Congress passed a reform to attract talent to senior executive positions
- Implemented across the board
- Two components:
 1. **recruitment:** public and transparent competitive recruiting process
 2. **financial incentives:** performance pay & higher unconditional wages

1. New recruiting process

- Before the reform: discretionary appointments by the superior officer/politician

1. New recruiting process

- **Before the reform:** discretionary appointments by the superior officer/politician
- **After the reform:** recruitment through public, competitive, and transparent processes

2. Financial Incentives

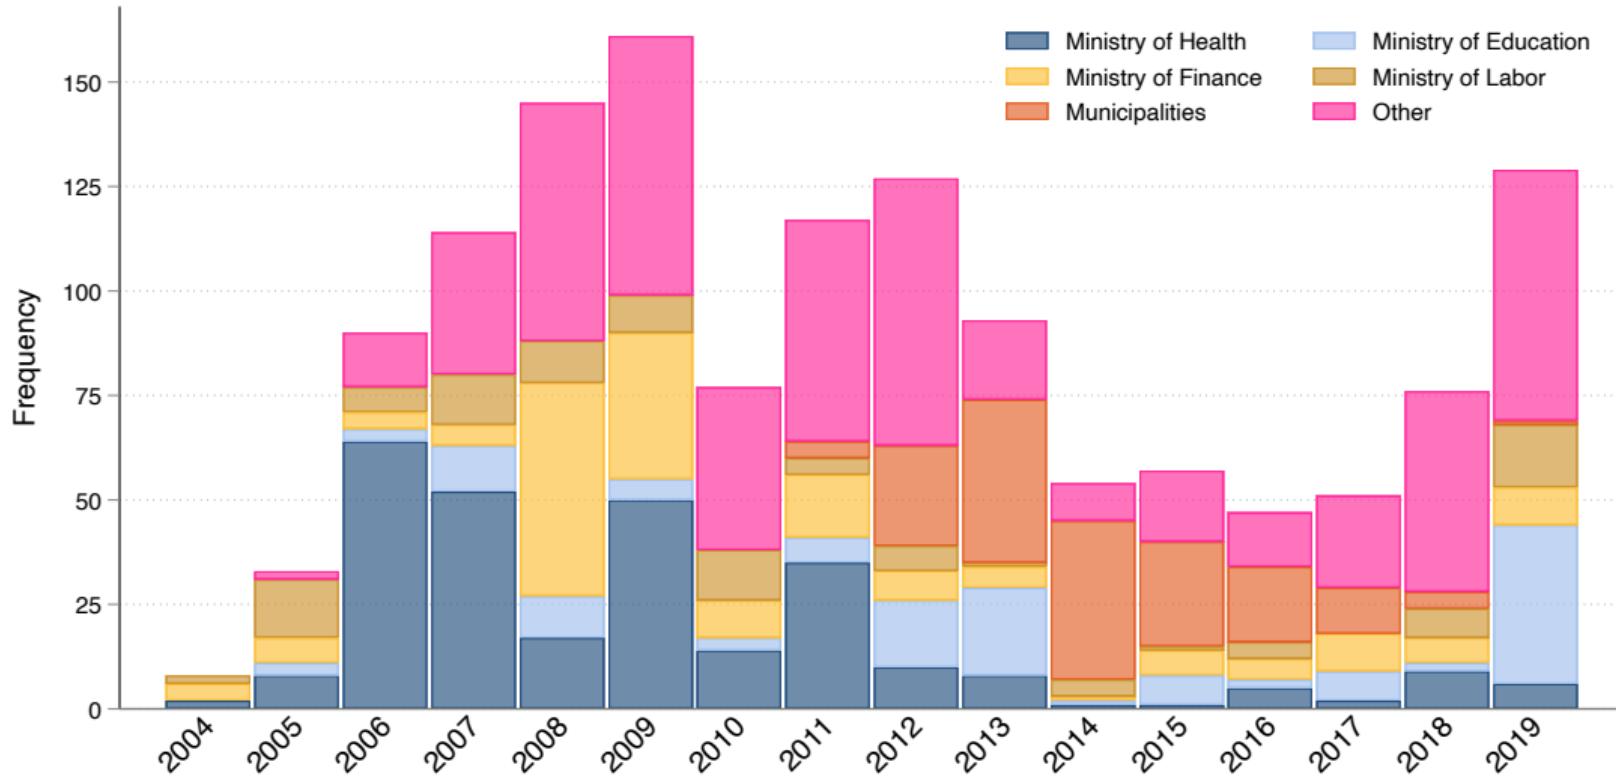

- (i) Higher base wages in the form of a monthly unconditional bonus
 - bonus is position specific
 - in our setting represents a 33% increase in the position's pay → [Box plot](#)

- (ii) Performance pay incentives:
 - depend on score drawn from performance contract
 - trivial penalty and no possibility of wage increase → [Schedule](#)
 - not binding in our setting (and across the board)

Public agencies gradually adopted selection reform

- Adoption occurs across several public organizations and is specific to a given position
- Once a position adopts the reform, has to select future appointees by new process
 ⇒ treatment is an absorbing state
- Adoption mainly explained by:
 1. constrained capacity of the Civil Service
 - in public hospitals, priority depends mainly on size/complexity
 2. turnover of incumbent managers in the position

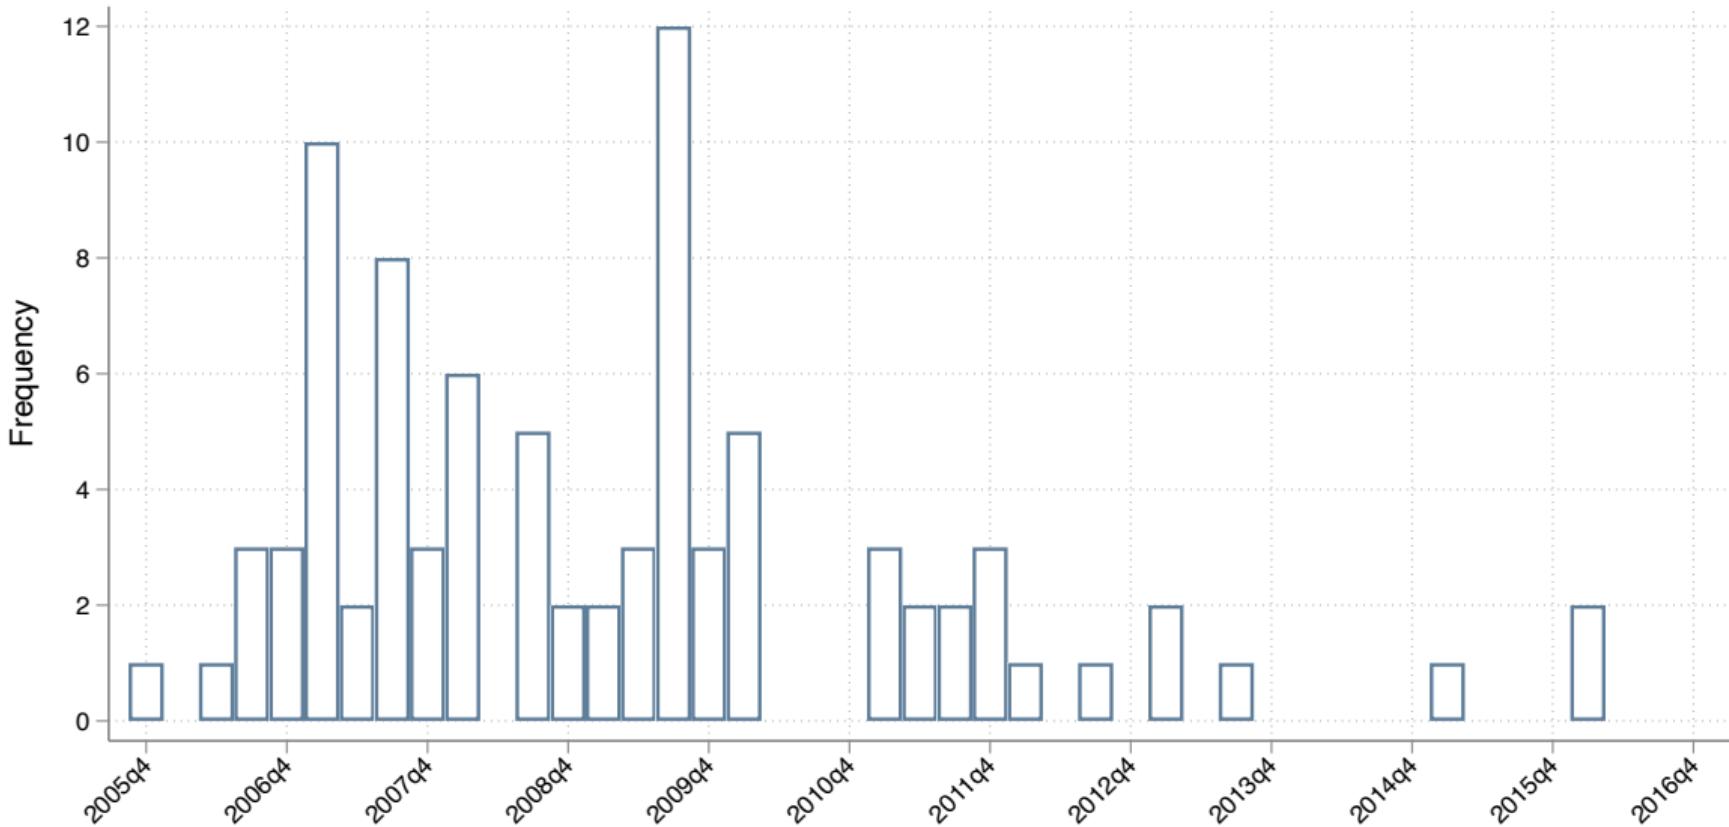

Public agencies gradually adopted selection reform ▶ # by year

Number of public agencies using the new recruitment process for the **first time**

Public hospitals adopting the reform

► CDF ▶ By hospital size

The healthcare system in Chile

- Health system has both public and private health insurers and providers
- Public insurance funded by general taxation and payroll taxes
 - individuals without the ability to pay can freely access public system
 - 78% of the population under public insurance
- Healthcare provision organized geographically in "Health Services" → [Figure](#)
 - decentralized organizations responsible for healthcare provision in their territory
 - referral and counter referral system is organized within these units
- Public hospital CEOs duties:
 - personnel administration, and allocation of inputs and HR
 - management of financial resources and proposing annual budget
 - infrastructure and technological equipment decisions→ [Management team](#)

Very little scope for selection within public network

- Individuals with public insurance cannot choose provider within the public network
- Individuals need to register in the primary healthcare center nearest to their residence
- Patients who need specialized attention are referred to specialty clinics or a hospital
- Referrals follow strict referral and counter-referral guidelines
 - based on primary care center location, and patient demographics and diagnosis

► Example ► Evidence

Data description

1. Employees in the public health sector

- [NEW] identity and characteristics of public hospitals CEOs (2001-19)
- restricted-use admin. records covering the universe of employees (2011-19)

2. Health Outcomes

- individual-level discharges in all public hospitals (2001-19)
- individual-level death records (2001-18)
- hospital-level inputs and procedures (2009-19)

3. Civil Service

- timing of adoption of the reform
- CEOs performance score

▶ Details

Main outcome variable: hospital mortality

- Main measure of output-based hospital performance: hospital mortality rate
(Gaynor et al. 2013; Bloom et al. 2015; Doyle et al. 2015; Gupta 2021; Chan et al. 2022)
- Procedure:
 - compute death indicators at patient level following a hospital event
 - aggregate by hospital and quarter
 - compute death rate dividing total deaths by # of inpatients
 - include deaths occurring in other locations 28 days after admission (Gaynor et al. 2013)
- Same procedure to compute case mix shares by hospital and quarter

Descriptive statistics

	Mean	Std.	Bottom	Median	Top	# of
	(1)	(2)	(3)	(4)	(5)	(6)
Number of deaths	38.21	63.27	1.00	12.00	116.00	13,988
Death rate	2.46	1.94	0.38	2.15	4.69	13,988

Outline

1. Setting and data
2. Reform impact on hospital performance
3. Recruitment effects of the reform
4. Role of financial incentives included in the reform
5. Conclusion

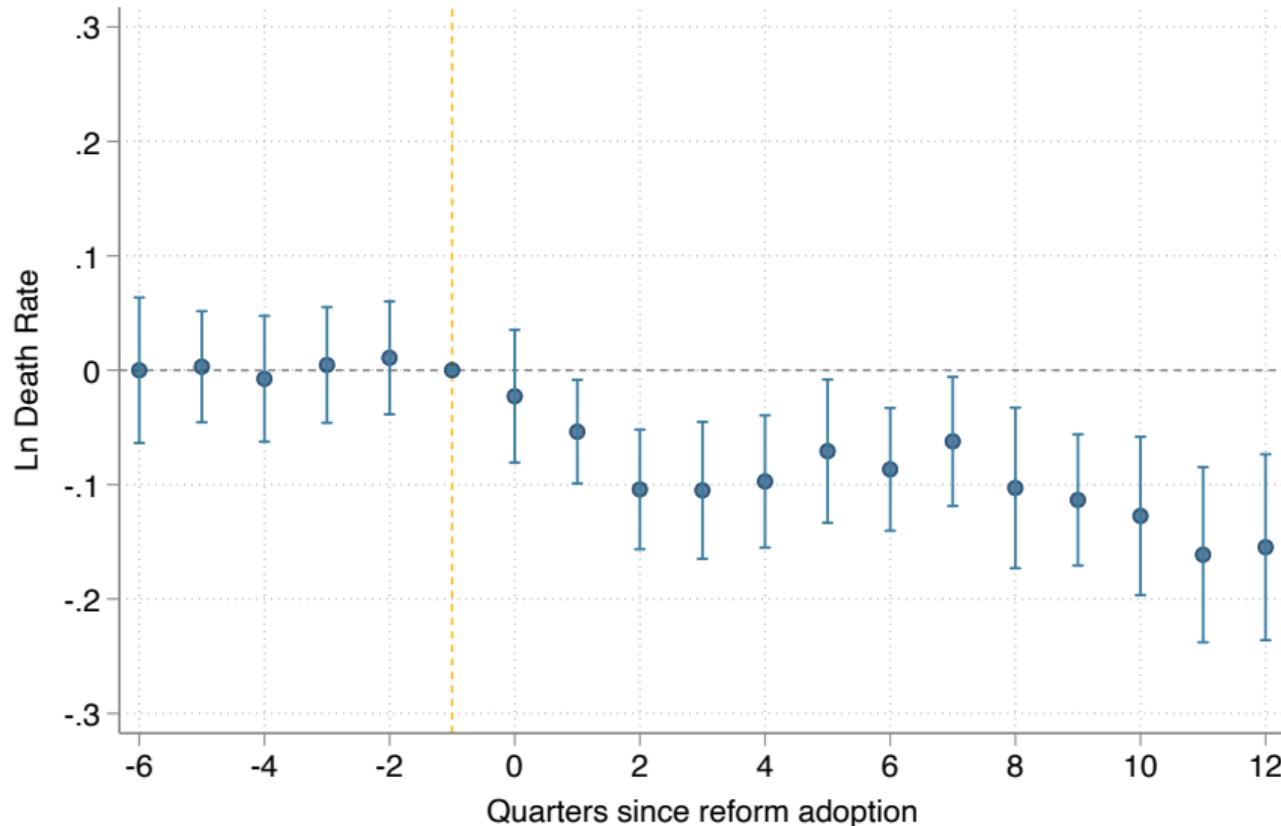

Impact on hospital performance

- We estimate the following event study:

$$y_{ht} = \alpha_h + \gamma_t + \sum_{k=-6}^{12} \beta_k D_{ht}^k + X'_{ht} \Delta + \epsilon_{ht},$$

- y_{ht} is a logged measure of an outcome at hospital h at time t
- D_{ht}^k indicates if hospital adopted new selection process k periods earlier or ahead
- X'_{ht} case mix controls (Propper & Van Reenen 2010, Gaynor et al. 2013)
- Standard errors clustered at the hospital level
- β_k are the effects of adopting new selection process for each k quarter
- Identifying assumption: parallel trends in absence of the policy

Impact on hospital performance

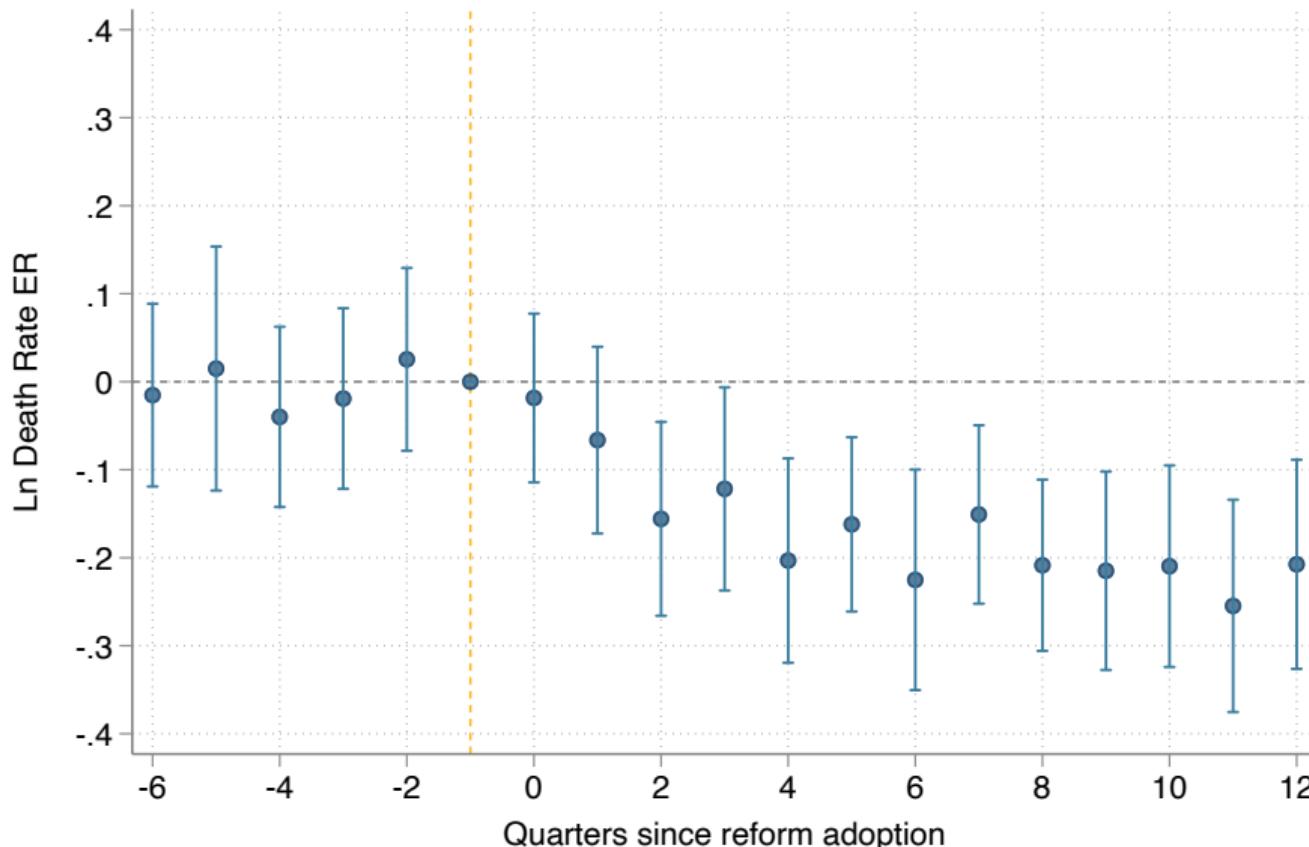

► Treatment effect heterogeneity

► Other outcomes

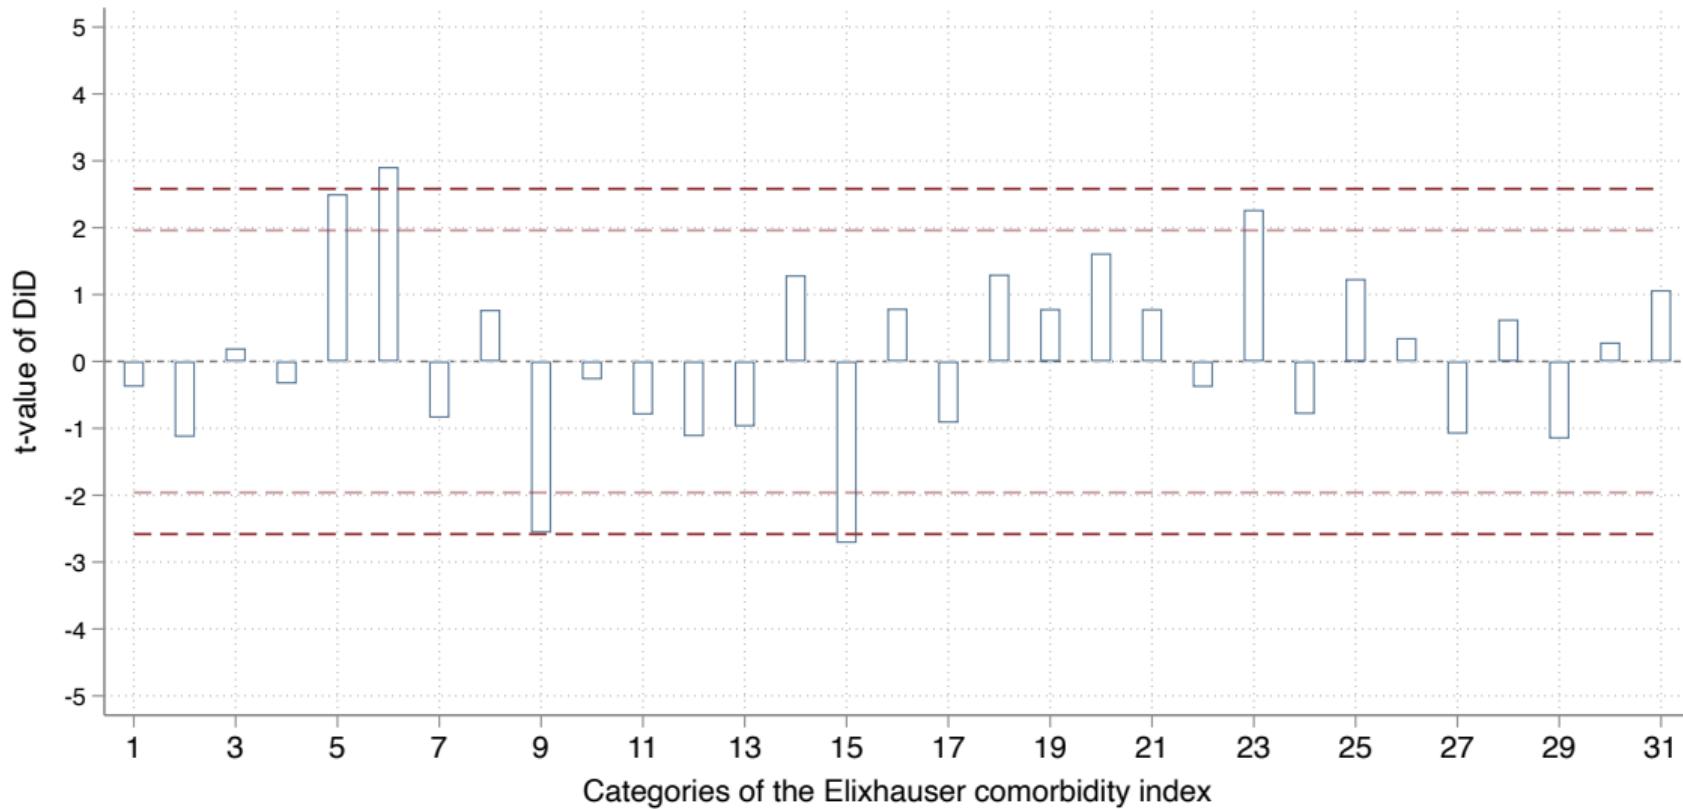

► CMS adjusted

► Poisson

Results are robust in specifications for ER patients

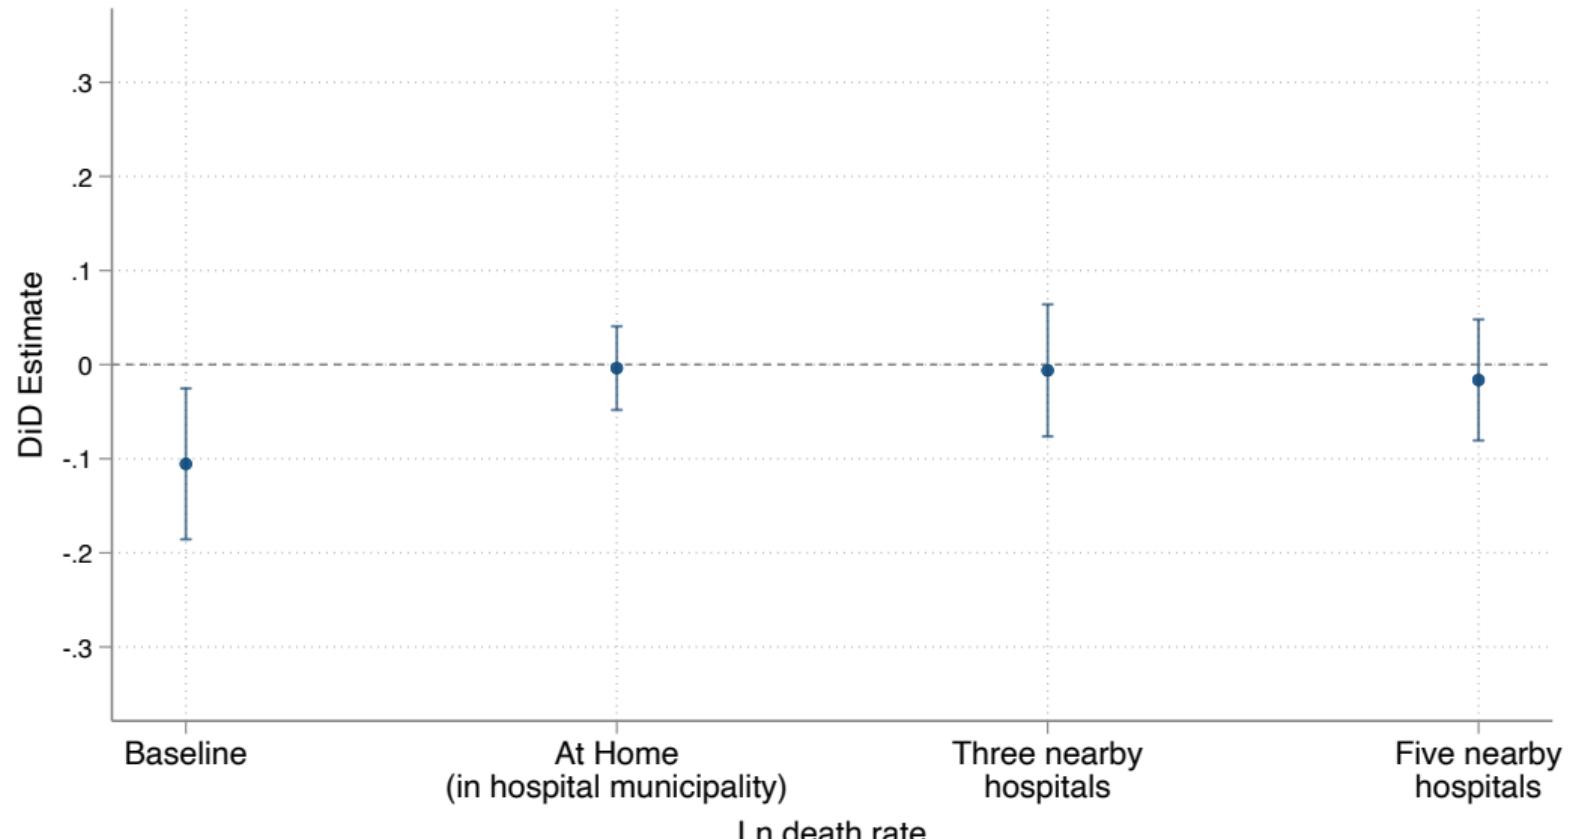

Diagnoses composition doesn't change after adoption

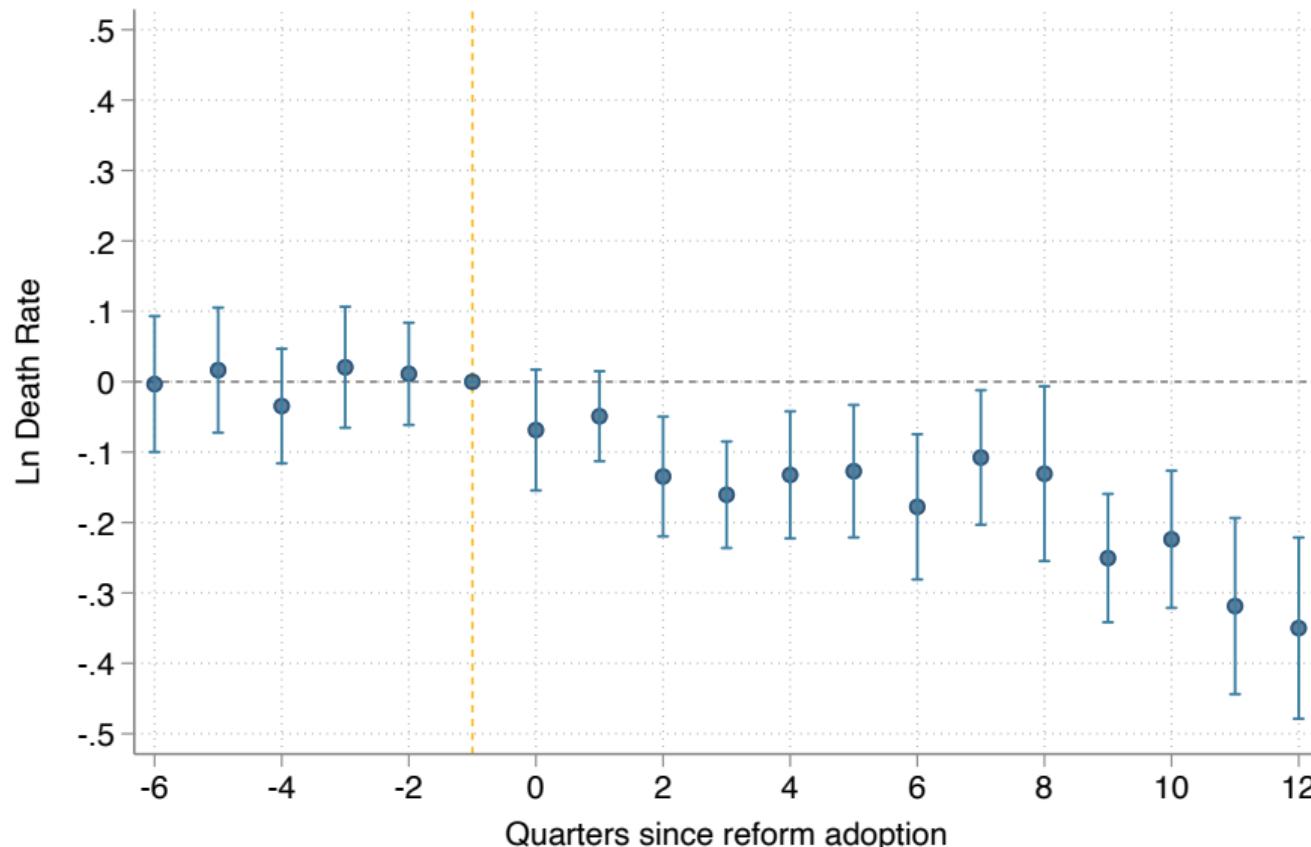

► Case mix doesn't change

No evidence of supply-side unobserved selection

No evidence of unobserved patient sorting

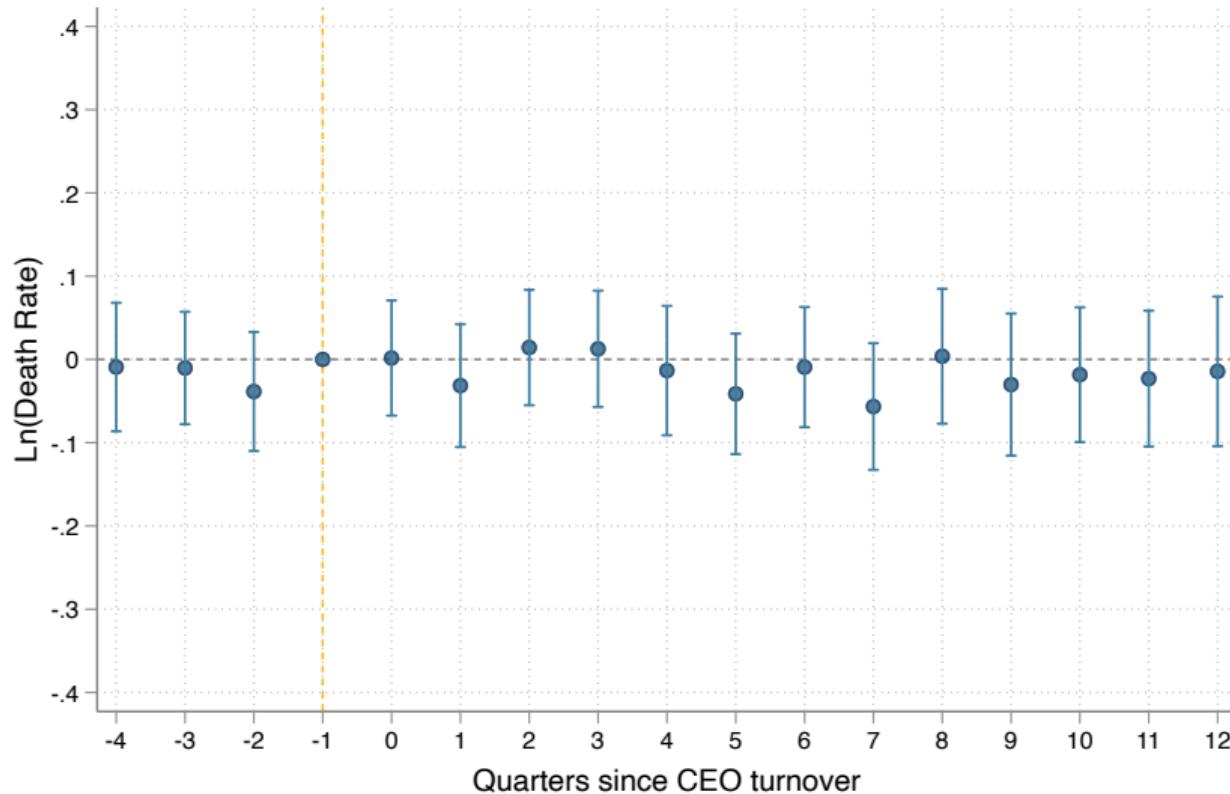

Are results mechanically explained by CEO transitions?

- Stacked event study to deal with multiple CEO transitions within hospital
(Cengiz et al. 2019, 2022; Baker et al. 2021; Atal et al. 2022)
- An event is a CEO transition in a never treated or yet-to-be treated hospital
- For each event:
 - define a time window around event: [-4, 12]
 - define a control group of hospitals with no transitions in the time window
- Select valid events: balanced & no transitions in 4 periods before event
- Append data for all valid events and estimate:

$$y_{hte} = \alpha_{he} + \gamma_{te} + \sum_{k=-4}^{12} \beta_k D_{hte}^k + \epsilon_{hte},$$

- e is a valid event

Are results mechanically explained by CEO transitions?

External validity: alternative research design

- Complement findings with different source of variation: rotation of CEOs
(Fenizia 2022)
- Estimate a model with CEO and hospital fixed effects → [Details](#)
(Abowd et al. 1999; Card et al 2013)
- Document that CEOs are important for hospital performance → [Evidence](#)
(Bertrand and Schoar 2003)
 - do not find match effects between CEOs and hospitals
- Selection reform had a substantial effect on CEO quality → [Evidence](#)

CEO selection reform in context of other policies

Notes: HHI: Herfindahl-Hirschman index; AMI: Acute Heart Infarction; Amb: arriving by ambulance; *: non-deferrable medical conditions.

Outline

1. Setting and data
2. Reform impact on hospital performance
3. **Recruitment effects of the reform**
4. Role of financial incentives included in the reform
5. Conclusion

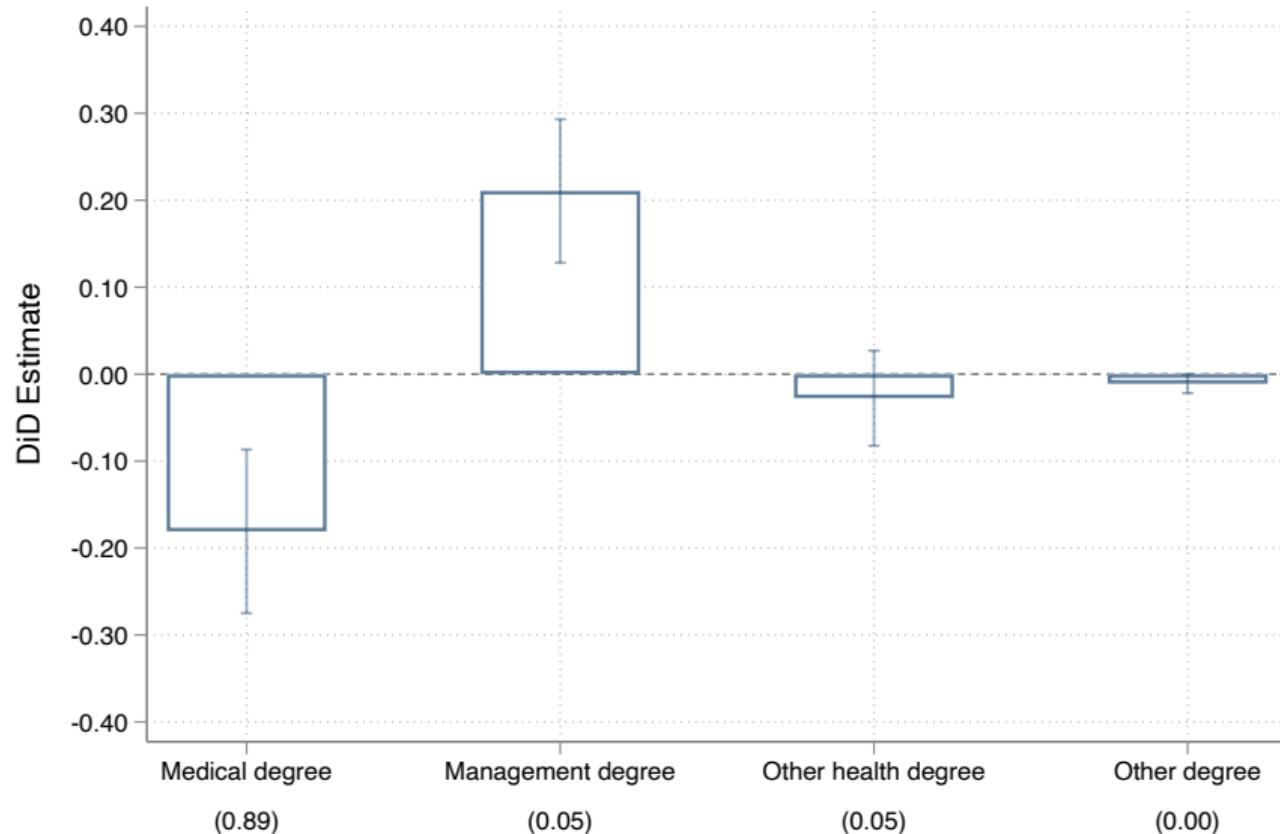

Impact of the reform on CEO characteristics

- We estimate the following staggered differences in differences:

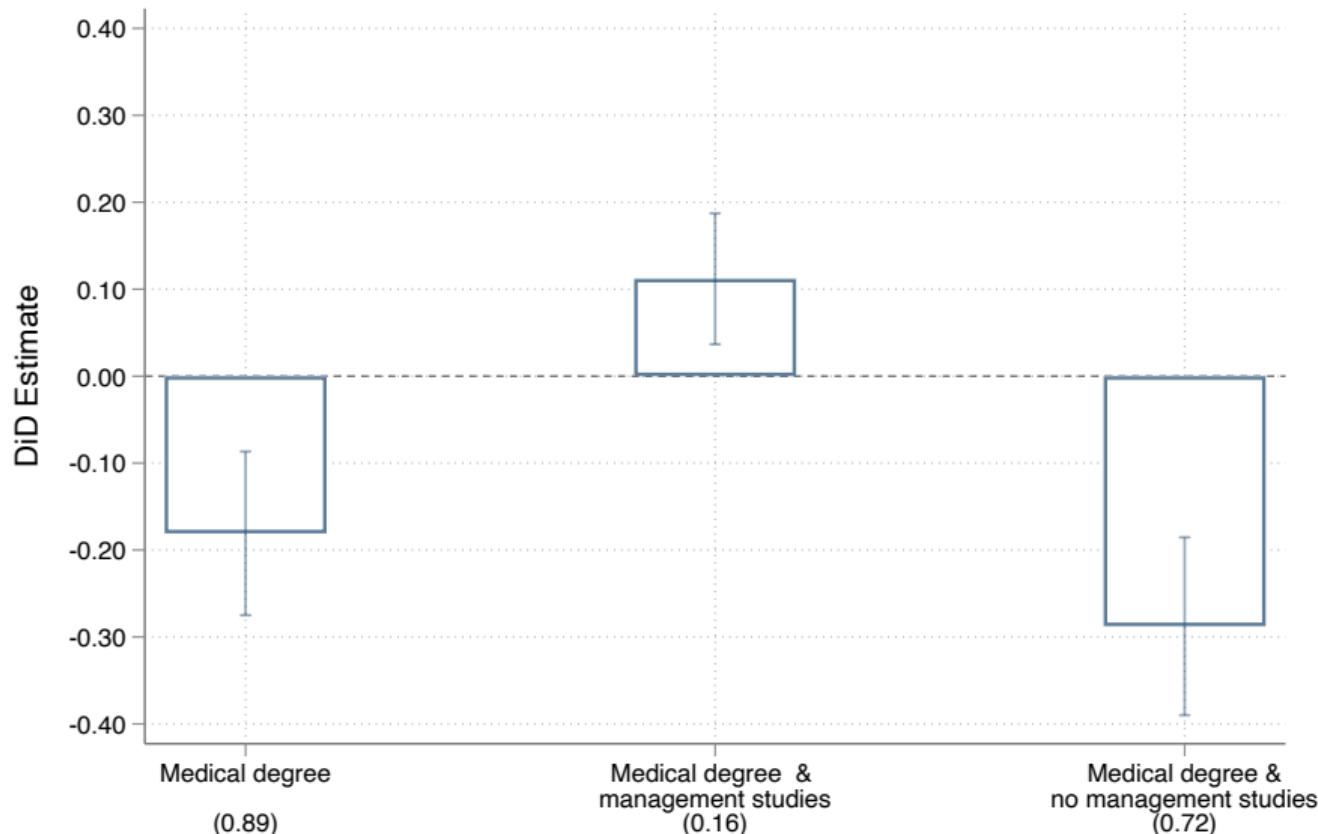

$$X_{M(h,t)} = \alpha_h + \alpha_t + \beta \times \text{Reform}_{ht} + \epsilon_{ht},$$

- $M(h, t)$ is a function indicating the identity of the CEO of hospital h at time t
- X are an individual-specific traits
- Reform_{ht} takes value 1 after hospital h adopts new selection process and 0 otherwise
- The coefficient of interest is β

Reform displaced doctor CEOs

MBA en salud para que médicos chilenos entren al mundo del management

La Universidad Mayor y la UNAB imparten programas de gestión hospitalaria.
Autor: [AméricaEconomía.com](#) | 12 November 2010

Algunas universidades chilenas ofrecen MBA en Salud, para que sus egresados puedan trabajar en cargos administrativos como gerentes o directores de hospitales e incluso Seremis.

Una de las instituciones que ofrece este MBA con especialización en Salud es la Universidad Andrés Bello (Unab), que permite a los alumnos adquirir y profundizar materias como economía, administración, marketing, epidemiología aplicada al management y gestión clínica.

La Unab ha realizado 21 versiones de este programa desde 2005, y su éxito se basa en su realización en varias ciudades del país, desde Iquique a Punta Arenas, en hoteles y hospitales, con más de 500 graduados, indicó el diario La Tercera.

También existe una versión de Alta Dirección, dirigida a profesionales con mayor experiencia y que pretenden alcanzar o mantenerse en altos puestos directivos. La diferencia de este programa es que cuenta con una doble titulación con la Escuela de Negocios Iede-UEM de España, incluso uno de los tres semestres que dura el MBA es impartido íntegramente por profesores españoles, y es necesario que los alumnos realicen una pasantía en Europa.

La Universidad Mayor cuenta con el MBA en Dirección y Gestión en Salud, un programa de un año y medio con un enfoque más estratégico, centrado en la solución de problemas, desarrollo del emprendimiento para nuevas ideas de negocios. El magíster de 18 meses cuenta con tres líneas de desarrollo, el análisis estratégico, gestión de empresa y dirección estratégica.

Este programa posee convenio de Grado Convalidado (Join Degree) con instituciones de Estados Unidos como la Universidad de North Florida y la Texas Christian University. En España, cuenta con el respaldo del EAE Business School.

Does attenuation of skills mismatch explain results?

- Definition: *the extent to which individuals are employed in an occupation unrelated to their main field of study*
- Several factors may create skill mismatches in public sector employees
(Besley et al., 2022)
 - social norm before reform: CEO positions reserved for doctors w/long careers
- The reform displaced doctor CEOs for professionals with management training
 - ⇒ potentially mitigated the skill mismatch
- We examine whether correcting skill mismatch enhances organization performance
 - limited or no research in the public sector (Nordin et al. 2010; Besley et al. 2022)
 - CEOs with management studies are well matched, the rest represent mismatches

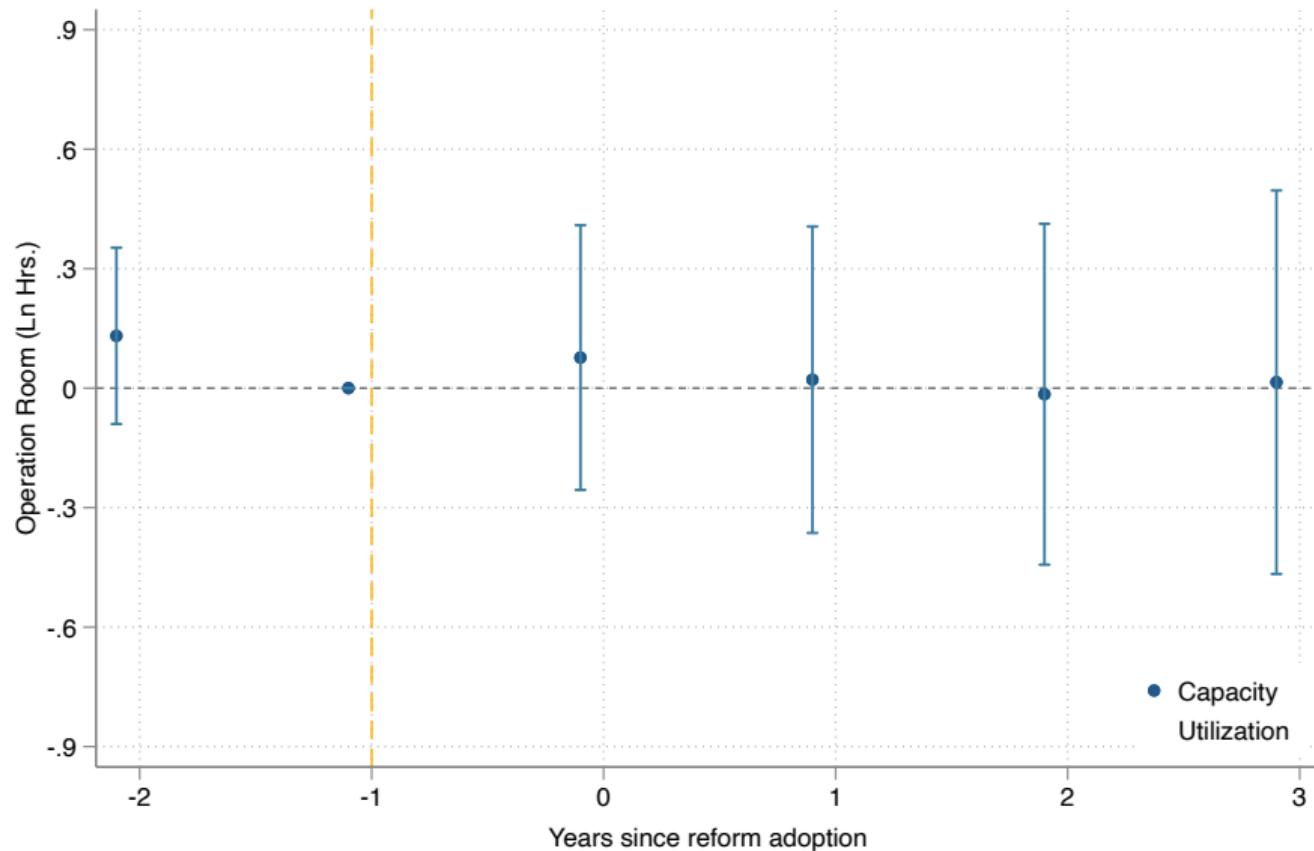

Differential reform impact by mgmt. training

► CEO transitions

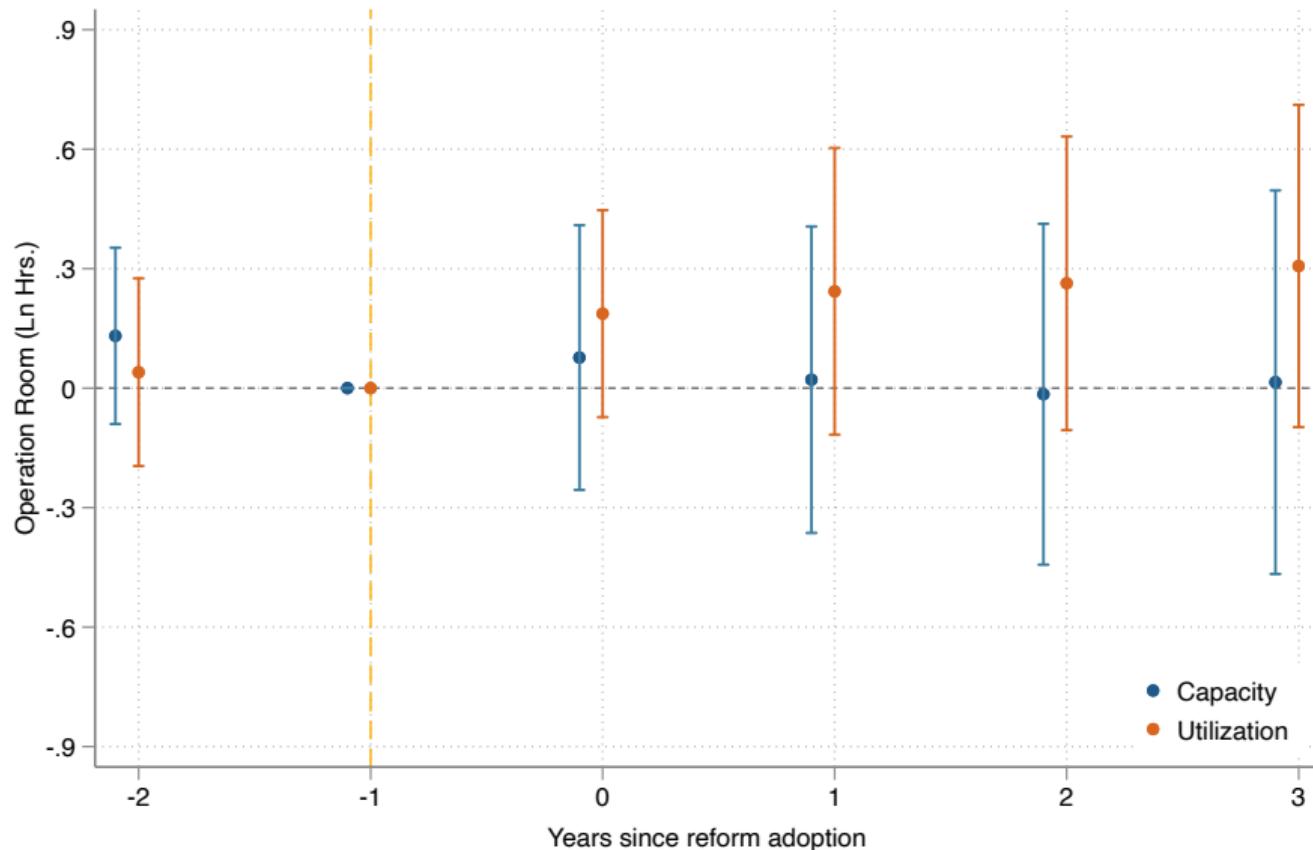

Identifying variation is:	Reform adoption			CEO transition	
	Ln Death (%) (1)	Ln Death (%) (2)	Ln Death (%) (3)	Ln Death (%) (4)	Ln Death (%) (5)
Reform & mgmt. undergrad.	-0.111*** (0.029)				
Reform & non-mgmt. undergrad.	-0.076*** (0.026)

Observations	8,085	8,085	5,732	71,027	193,177
Mean Dep. Variable	2.63	2.63	2.49	2.88	2.41

Notes: all regressions include time FE, hospital FE, and case mix controls

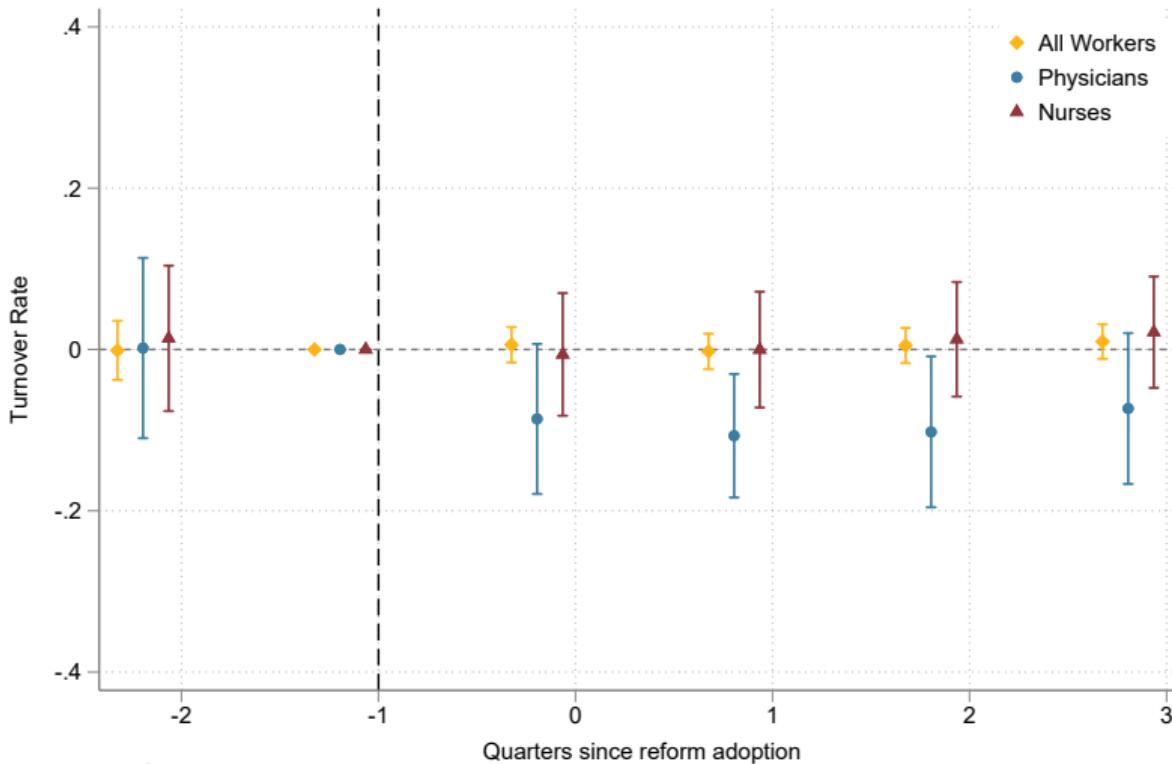

Mechanisms: more efficient utilization of operating room

Mechanisms: more efficient utilization of operating room

Mechanisms: reduced turnover of doctors

► No effect on personnel wages

Outline

1. Setting and data
2. Reform impact on hospital performance
3. Recruitment effects of the reform
4. **Role of financial incentives included in the reform**
5. Conclusion

Role of financial incentives included in the reform

- Reform included financial incentives: performance pay incentives and higher wages
- Financial incentives might affect two margins:
 - who is selected (Dal Bó et al. 2012)
 - effort exerted by selected CEOs
- Financial incentives can increase performance of public employees
(Khan et al. 2015; Biasi 2021; Deserranno et al. 2022)

Performance pay incentives in the reform

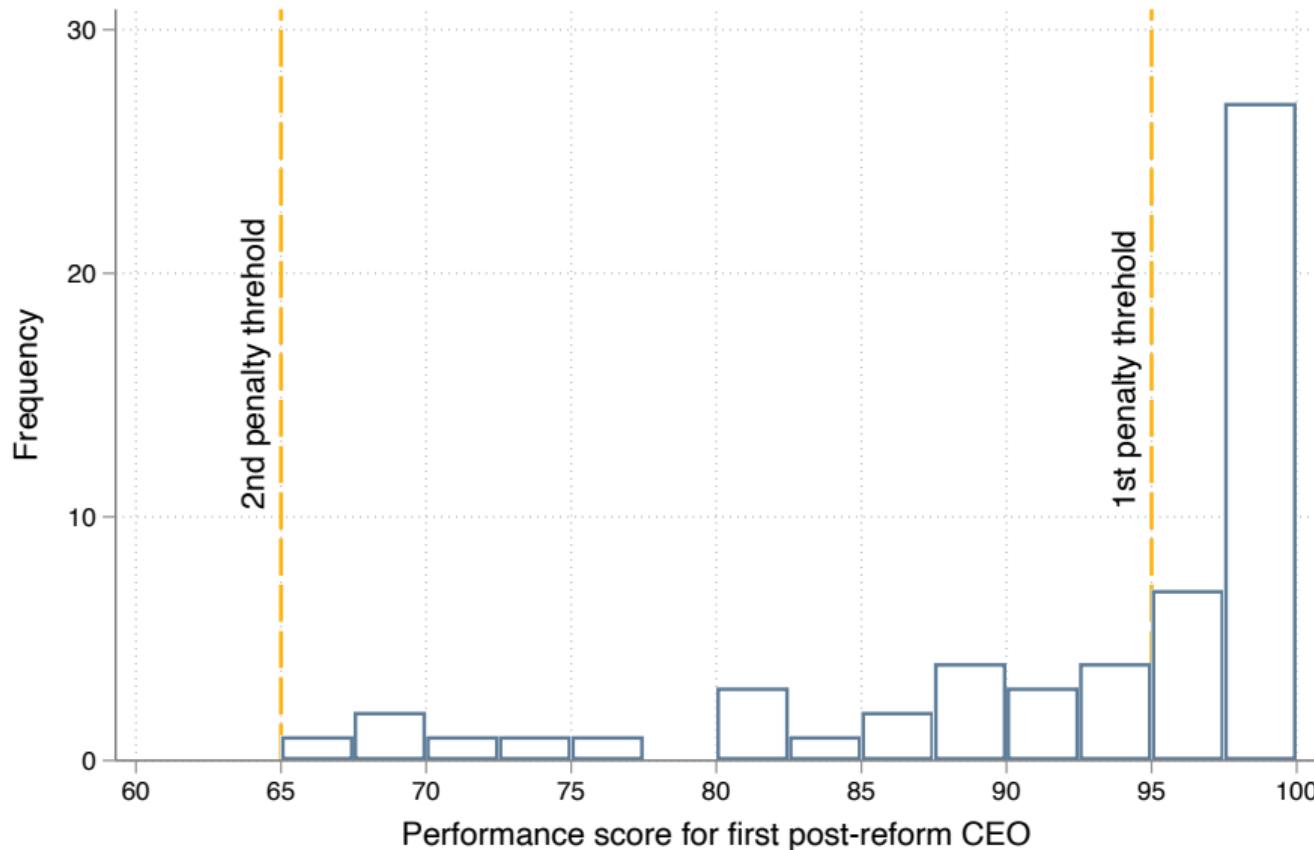

- Theoretical prediction: performance pay induces higher effort (Lazear 2000)
 - might drive the results conditional on being selected
- Senior executives agree to a 3-year performance contract
 - get a performance score based on the parameters in the contract
- Performance score impacts compensation according to:

$$\text{Yearly Wage}_t = \begin{cases} 100\% & \text{if } \text{performance}_{t-1} \geq 95\% \\ 98.5\% & \text{if } 65\% \leq \text{performance}_{t-1} < 95\% \\ 93\% & \text{if } \text{performance}_{t-1} < 65\%. \end{cases}$$

- performance incentives de-facto lax, non-binding, and apply after second year

Performance pay had no bite

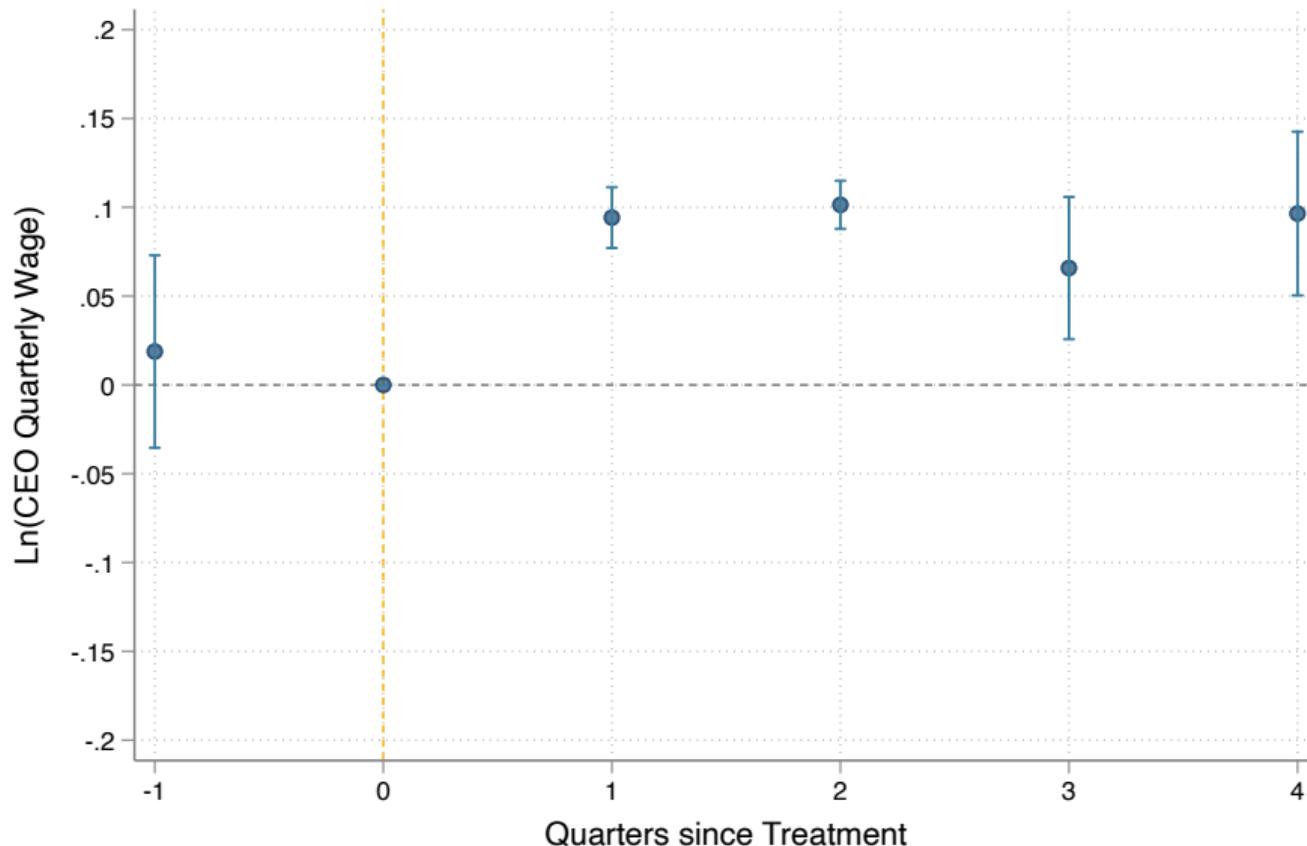

► Regression results

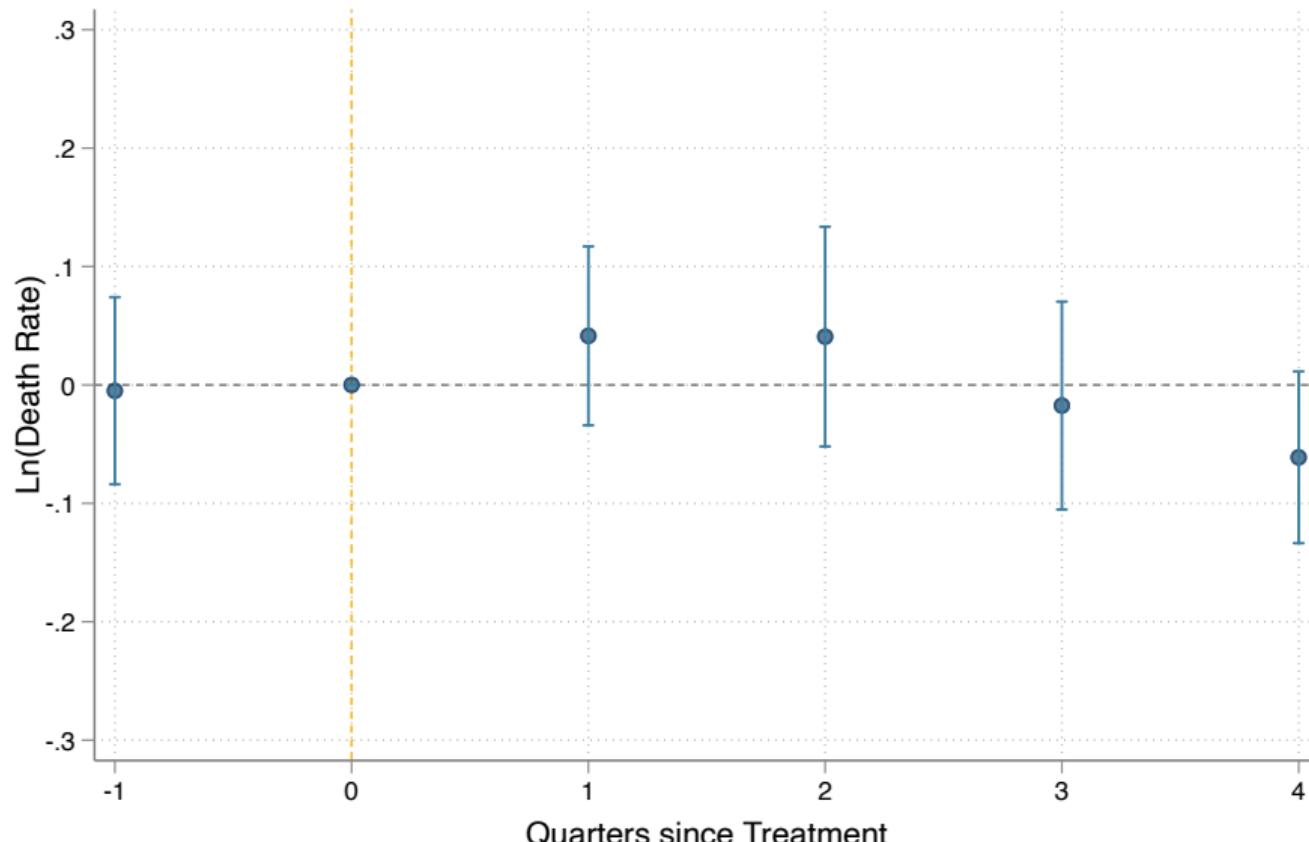

Are new CEOs exerting more effort due to higher wages?

- Efficiency wages hypothesis (Katz 1986)
 - Selection reform increased wages by $\approx 33\%$ on average → Wage effects
 - Aim: isolate effect of efficiency wages (if any)
 - Exploit an **amendment** to the reform that changed the pay scheme:
 - doctor CEO appointed after Nov. 2016: could choose medical laws pay grade
 - change did not affect CEO pay for non doctors
 - event: CEO transition after 11/16 & using new selec. system & CEO is doctor
- ⇒ run a stacked event study on wages and hospital performance → Details

Amendment to the reform effect on wages

Results are not explained by higher wages

Conclusion

- Placing emphasis on public managers is popular policy to improve govt. efficiency
 - We leverage a reform that changed the way public managers are selected in Chile
 - Find that the reform decreased death rates by between 9% to 14% in public hospitals
 - results are not driven by a change in patient composition
 - conditional on appointment, financial incentives don't drive results
 - Created novel dataset to examine effects of the policy on characteristics of new CEOs
- ⇒ Policy appointed CEOs with mgmt. training and displaced doctor CEOs without it
- results driven by new CEOs with management training
 - results robust to alternative research designs

CMS risk-adjusted results

- Concern: hospital death rates might reflect shifts in patient characteristics
- CMS risk-adjusted mortality is a reliable and valid indicator of hosp. quality in the U.S.
(Doyle et al. 2019)
 - the institutional setting is prone for patient selection
- Procedure:
 1. Fit a logit of dead at the patient level on a set patient charac. in the pre-period
 2. Predict death likelihood at the patient level
 3. Compute the average predicted death rate at the hospital level, \bar{y}_{ht}
 4. Risk-adjusted mortality is $y_{ht} - \bar{y}_{ht}$

Alternative research design

» Back

- Exploit the rotation of CEOs across hospitals to study impact on hospital quality
- Consider following model:

$$\text{Ln(death rate)}_{ht} = \alpha_h + \psi_{M(h,t)} + \gamma_t + X'_{ht}\Delta + u_{ht},$$

- α_h and $\psi_{M(h,t)}$ are hospital and CEO fixed effects, respectively

- For estimation: condition on connected sets (Abowd et al. 1999; Card et al 2013)
 - # CEOs: 691; # hospitals: 105; # connected sets: 27; # movers: 74

Amendment to the reform: stacked event study

› Back

- An event is a transition after 11/16, using new selec. system & new CEO is doctor
- For each event:
 - define time window around event: [-1, 4]
 - define control group:
 - (i) units with no transitions
 - (ii) transitions to professionals other than doctors
- Select valid events (26/35): balanced & no transitions 3 periods before event
- Append data for all valid events and estimate:

$$y_{hte} = \alpha_{he} + \gamma_{te} + \sum_{k=-1}^4 \beta_k D_{hte}^k + \epsilon_{hte},$$

- e is a valid event
- y is either the CEO's wage or the hospital's death rate

Reform incentivized doctors to study management

[Back](#)

Some Chilean universities offer an MBA in Health, so that their graduates can work in administrative positions such as managers or directors of hospitals and even Seremis.

One of the institutions that offers this MBA with a specialization in Health is the Andrés Bello University (Unab), which allows students to acquire and deepen subjects such as economics, administration, marketing, epidemiology applied to management and clinical management.

Unab has carried out 21 versions of this program since 2005, and its success is based on its implementation in several cities in the country, from Iquique to Punta Arenas, in hotels and hospitals, with more than 500 graduates, reported the newspaper La Tercera.

There is also a Senior Management version, aimed at professionals with more experience and who intend to achieve or remain in senior management positions. The difference of this program is that it has a double degree with the lede-UEM Business School of Spain, even one of the three semesters that the MBA lasts is taught entirely by Spanish professors, and it is necessary that the students carry out an internship in Europe.

Universidad Mayor has the MBA in Health Management and Management, a one-and-a-half year program with a more strategic focus, focused on problem solving, development of entrepreneurship for new business ideas. The 18-month master's degree has three lines of development: strategic analysis, business management and strategic direction.
